AGE DISTRIBUTION

This Bulletin, the 26th of a series dealing with population, relates to "Age Distribution" of the population as enumerated in the Seventh Census of Canada, 1931.

Age statistics comprised one of the most necessary, as well as the most difficult divisions of census inquiry. While the figures of this bulletin are restricted to the classification of the population by single years of age or by age groups, nevertheless age statistics enter with vital significance into nearly every phase of population classification. There are few subjects which can be adequately discussed without the study of ages in correlation with the data more peculiar to the subject. For this reason a great deal of the material on ages will be found in other fields of census results. For example, the true incidence of mortality can be determined only when the population can be distributed by age and sex. A knowledge of the age distribution by sex and conjugal condition is necessary in ascertaining birth rates. Statistics of school attendance and illiteracy have value only when age is taken into account. The age distribution of the native and immigrant population is an important factor in determining the economic, social, and political effects of immigration.

Errors in Age Returns.- It is impossible to claim absolute accuracy for census figures of ages because (1) a considerable number of persons do not know their true age, (2) in a number of instances the enumerator obtained information relating to the person enumerated from a third person, probably the proprietor of a hotel or boarding house, who could give the age only approximately, and (3) the age in certain cases is intentionally misstated.

Age Clustering.- There is also a tendency of people to state their ages in years ending with 5 or 0. For example, the number of persons reported at the ages of 30, 40, 50 or 60 is much greater than the numbers reported for either the years immediately preceding or following. Ages were not published by single years of age prior to 1911. The number of persons reported at the age following the decennial or quinquennial group when compared with the number at the age immediately preceding would seem to indicate that the round age method of reporting ages was not due to a desire to misrepresent, but rather because of carelessness, illiteracy, or ignorance of the value of a correct record of ages in all fields of population statistics.
